

How-to: Turn on the Projector

Introduction

The projector is used to produce the image on the main screen above the stage. The current model is a 'laser projector' which uses lasers to produce the image rather than an incandescent bulb, as in older models. The laser modules have a much longer life than a projector bulb would however it is still best not to turn on the projector until just before people start arriving, to prolong its life as much as possible.

Touch Screen

This projector is turned on using the AMX touch-screen unit to the right of the iMac. A glow is visible from out of the back of the projector as soon as it is switched on, however it can take a couple of minutes to 'warm-up' and begin producing an image.

Remote Control

If it is not possible to use the touch screen, or the projector is not responding to the touch screen, it is also possible to control it using its remote control. This is kept in the tray on the back right of the projection desk. As when using the touch screen a glow is visible from out of the back of the projector as soon as it is switched on, however it can take a couple of minutes to 'warm-up' and begin producing an image.
